DESCRIPTION

A simple and secure digital lock with an emergency manual override key which gives the system manager the ability to assign user codes from a remote location using an online database. Users no longer need to carry keys with them and reduces running costs by removing the need for service calls to change lock codes locally. Typical applications are lockers and personal storage.

FEATURES

Combination Padlock with Master Key Override
Self powered, 2 standard AA batteries
Emergency manual override key
Available in black (standard), silver and white
Available vertical position (standard) or horizontal alignment for smaller doors
IP65 Water resistant option available
Suitable for wide variety of storage applications
Easy 4 digit user pin
Battery condition indicator
Master and technician codes

DETAILS

Product Code	Description
SW3780/RAS	Digital combination lock with remote code changing and allocation. Master code & manual key override. Colour: Black

Online System

Management of RAS Locks is via an intuitive web based system. This is accessible from desktops or hand held devices.

If you are managing multiple installations, they are all controlled from this one convenient website.

Once online the manager can see at a glance which locks are currently available and allocate these to new users. The storage or rental period can be an individual, a group of users, or even set to unlock automatically after a set period of time. All this at the push of a button.

Leisure

Hotel spa and gymnasium customers often struggle to find suitable coins when they come to use temporary lockers. The RAS digital combination lock removes this frustration by issuing the customer a 4-digit pin which remains valid for the duration of their visit. This pin is handed to the customer at the reception desk, together with the locker location.

Business

Many businesses are now offering home and flexible working arrangements, and so the need to use any desk or working area is becoming both popular and desirable. By using the RAS system a business can now provide secure personal storage and remotely allocate access for staff who require a locker for a temporary period.

Education

Many schools and colleges now provide lockers and personal storage as a chargeable option. The RAS system allows the student to rent and pay for the service via a website. The service provider then sends a text or email to the student with their locker location and pin number. At the end of term, the next user pin is then remotely allocated to the new student without the need to reprogram the lock.

Festivals

Secure storage and charging areas for smart phones and tablets are becoming a popular option with most festival events now offering a web link to book these temporary storage areas. The RAS system makes the whole experience fast and seamless as the rental confirmation, locker location and user pin can be issued via a single text or email. As can the reallocation of numbers for the next user.
